Office of Origin: Department of Hospital Epidemiology and Infection Prevention (HEIP) and Facilities Management

I. PURPOSE

A. Dust and debris generated from construction/demolition activities can contain a mold or fungus, which, if inhaled by immune-compromised patients, can cause disease and even death. To provide parameters for safe design, construction, maintenance and sustainability in the healthcare environment for our patient population, visitors, and employees, dust mitigation measures must be utilized during all construction activities at the Medical Center. Dust-generating construction activities that disturb existing dust or create new dust must be conducted in enclosures that prevent the flow of particles into patient areas.

II. REFERENCES

D. California Code of Regulations, Title 22.

III. DEFINITIONS

A. Construction Activity Types

The construction activity types are defined by the amount of dust that is expected to be generated, the duration of the activity, and the amount of shared HVAC systems (Table A). For questionable activity, contact the construction site project manager (name and contact number posted at the construction site), UCSF Medical Center Facilities: (415) 514-3570 or Hospital Epidemiology and Prevention (HEIP) (415) 353-4343.
### Table A. Types of Construction Activities

<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type A</strong></td>
<td><strong>Inspection and non-invasive activities.</strong> These include, but are not limited to:</td>
</tr>
<tr>
<td></td>
<td>• removal of ceiling tiles for inspection (up to 4 square feet)</td>
</tr>
<tr>
<td></td>
<td>• movement of equipment, building structures, etc. for visual inspection</td>
</tr>
<tr>
<td></td>
<td>• painting (but not sanding)</td>
</tr>
<tr>
<td></td>
<td>• putting up wall covering, electrical trim work, minor plumbing, and activities which do not generate dust or require cutting of walls or access to ceilings other than for visual inspection.</td>
</tr>
<tr>
<td><strong>Type B</strong></td>
<td><strong>Small scale, short duration activities that create minimal dust.</strong> These include, but are not limited to:</td>
</tr>
<tr>
<td></td>
<td>• installing telecommunications cabling</td>
</tr>
<tr>
<td></td>
<td>• accessing chase spaces</td>
</tr>
<tr>
<td></td>
<td>• cutting of walls or ceiling where dust migration can be controlled.</td>
</tr>
<tr>
<td><strong>Type C</strong></td>
<td><strong>Work that generates a moderate to high level of dust or requires demolition or removal of any fixed building components or assemblies (e.g., counter tops, cupboards, sinks).</strong> These include, but are not limited to:</td>
</tr>
<tr>
<td></td>
<td>• sanding of walls for painting or wall covering</td>
</tr>
<tr>
<td></td>
<td>• removing of floor and wall coverings, baseboards, ceiling tiles and casework</td>
</tr>
<tr>
<td></td>
<td>• new wall construction</td>
</tr>
<tr>
<td></td>
<td>• minor duct work or electrical work above ceilings</td>
</tr>
<tr>
<td></td>
<td>• major cabling activities</td>
</tr>
<tr>
<td></td>
<td>• any activity which cannot be completed within a single work shift</td>
</tr>
<tr>
<td><strong>Type D</strong></td>
<td><strong>Major demolition, construction and renovation projects.</strong> These include, but are not limited to:</td>
</tr>
<tr>
<td></td>
<td>• activities which require consecutive work shifts</td>
</tr>
<tr>
<td></td>
<td>• heavy demolition or removal of a complete cabling system required</td>
</tr>
<tr>
<td></td>
<td>• new construction.</td>
</tr>

*Designation of grouping for any location may be changed at the discretion of HEIP.
CONSTRUCTION ACTIVITY/INFECTION PREVENTION MATRIX

Determine the level of infection prevention classification necessary for the work by matching the construction activity with the designated risk group in the matrix below (Table C). Plan for and use the associated infection prevention barriers as determined in conjunction with HEIP and Project Managers.

A copy of the Infection Prevention Risk Assessment and Mitigation Plan (IPRAMP) must be submitted to HEIP when the matrix indicates that Class III or Class IV preventive measures are required. Adaptations to the prevention measures may be made only after HEIP staff have provided approval. HEIP personnel will be consulted when construction activities are placed in hallways adjacent to Group 3 or Group 4 areas (see Table B above).

A copy of the Infection Prevention Risk Assessment and Infection Prevention Mitigation Plan checklist must be sent to HEIP for review when the matrix indicates that Class III or Class IV preventive measures are required.

IV. POLICY

The guidelines are designed to maintain air quality and dust mitigation in the Medical Center during construction, demolition, or renovation projects.

V. PROCEDURES

NOTE: Not all dust mitigation measures described on this form are required for each project. Each project will be assessed independently.

A. The Construction Sub-Committee of the Infection Prevention? Committee oversees these procedures.

B. Infection Prevention Components for Construction/Renovation/Demolition Projects
Guidelines for Construction/Renovation/Demolition Projects and Environmental Control of Invasive Fungal Infection and other Hospital Acquired Infection

Infection Prevention Risk Assessment and Mitigation Plan (IPRAMP). Infection risks, interventions, and prevention strategies must be considered in planning for new construction and/or renovation of healthcare facilities. An IPRAMP is developed for all projects that may impact the health of patients. The IPRAMP multidisciplinary, documented assessment process is intended to proactively identify and mitigate risks from infection that could occur during construction activities. The scope of the project will dictate others who may be involved. The IPRA/IPMP shall be a part of integrated facility planning, design, construction, and commissioning activities. A risk assessment and mitigation plan form (Appendix A) will be completed by the project manager during the planning phase of the project, prior to the bidding process.

This risk assessment is based on these factors of the project:

- Nature and scope of project and expected dust generation
- Location
- Duration
- Patient populations likely to be affected

Based on the IPRAMP, dust mitigation strategies during the entire project are reviewed during the Interim Life Safety Measures meeting (see section IV.C). HEIP must review and approve the risk assessment and mitigation plan prior to the beginning of any construction activities.

Based on preconstruction IPRAMP, the owner shall provide the following recommendations to incorporate into the program:

1. Design recommendations generated by the IPRA.
2. Infection Prevention risk mitigation recommendations (IPRMP).

IPRAMP Design Elements:

1. Number, location, and type of airborne isolation and protective environment rooms.
2. Number, location, and type of plumbed hand-washing stations, hand sanitation dispensers, and emergency first-aid equipment (eyewash stations and deluge showers).
   - The number and location of hand-washing stations and hand-sanitation dispensers shall be determined by the functional program and the IPRAMP.
   - Hand-washing stations will be convenient and accessible for healthcare personnel and all other users.
3. Special HVAC needs to meet the functional program and accommodate the services included in or affected by the project (e.g., surgical services, airborne isolation rooms, laboratories, pharmacies, and other special areas).
4. Water systems to limit Legionella and other waterborne opportunistic pathogens.
Surfaces and Furnishings:

1. Existing code requirements are to be met.
2. Easy to maintain, repair, and clean.
3. Does not support microbial growth.
5. See “FGI Design p. 18 A1.2–3.2.1.5 Surface selection characteristics and criteria” for additional detail.

Construction Elements: When conducting the IPRA and developing the mitigation requirements for building and site areas anticipated to be affected by construction, the following shall be addressed:

1. The impact of disrupting essential services to patients and employees.
2. Determination of the specific hazards and protection levels for each designated area.
3. Location of patients according to their susceptibility to infection and the definition of risks to each.
4. Impact of movement of debris, traffic flow, spill cleanup, and testing and certification of installed systems.
5. Assessment of external as well as internal construction activities.
6. Location of known hazards.

Compliance Elements:

1. IPRA Documentation: The written record shall remain an active part of the project documents for the duration of the construction project and through commissioning.
   The IPRA is filed into the master file for the specific project.
2. The IPRAMP will expire 90 days after the initial approval date. A new IPRMP must be completed and approved by Hospital Epidemiology and Infection Prevention.
3. IPRMRs (infection prevention risk mitigation recommendations). Written plans that describe the specific methods by which transmission of air- and waterborne biological contaminants will be avoided during construction as well as during commissioning, when HVAC and plumbing systems and equipment are started/restarted.

C. Interim Life Safety Meeting

To address situations in which Life Safety Code deficiencies cannot be corrected during periods of construction or other impairment and to provide guidance on type and extent of special measures to compensate for increased life safety risk.

Before on-site construction begins, the project manager shall hold mandatory Interim Life Safety Measures (ILSM) meetings. Refer to EOC Policy 5.1.2 Interim Life Safety Measure.

Environment of Care Manual (EOC)
D. Annual Training for Design & Construction: Project Managers and Inspectors of Record (IOR) will attend an annual in-service training covering current dust mitigation measures. This in-service is sponsored by HEIP (Appendix B).

E. Pre-construction Infection Prevention Inspection
   1. After dust mitigation measures are in place and before demolition begins, the project manager, with HEIP and the contractor at the job site, schedules an inspection of the job site. The “PRE-CONSTRUCTION INFECTION PREVENTION SURVEY” form (Appendix C) will be completed at the time of this walk-through.
   2. When the PRE-CONSTRUCTION INFECTION PREVENTION SURVEY form is completed and signed, it will be posted at the project site.

   3. While UCSF Design and Construction and Facilities Management staff regularly inspect the project site for adherence to dust mitigation measures (Appendix F), HEIP staff may visit the project site at will. If dust mitigation measures are either not in compliance or barriers and/or measures fail, it is the responsibility of the observer to notify the Project Manager and construction supervisor for immediate remedy. The Project Manager shall then communicate the non-compliance or failure to the Inspector of Record for inspection and documentation.

   4. Large projects may require several phases of demolition and/or construction. Each phase may require a separate pre-construction Infection Prevention inspection.

   5. Major exterior construction, demolition or remodeling projects performed in the vicinity of Medical Center buildings also require contractor compliance with dust mitigation measures. These include but are not limited to partial or total building demolition adjacent to UCSF controlled properties. (Appendix D)

F. Air Sampling: HEIP may order air sampling, including particle counts, monitoring for airborne mold spores, and culturing for mold, which will be performed by the Office of Environmental Health and Safety. (Appendix E)

VII. APPENDIX 5.1A

Infection Prevention Risk Assessment and Infection Prevention Mitigation Plan including Preventive Measures Checklist for Medical Center Construction and Renovation

Instructions for Completing the Checklist

The Risk Assessment and Plan including the Preventive Measures Checklist will be completed during the design planning phase of the construction/renovation project by the multidisciplinary planning group. Infection Prevention personnel must be involved in each phase of the project to ensure that the appropriate prevention measures are initiated and maintained. The Infection Prevention Risk Assessment and Infection Prevention Mitigation Plan will automatically expire 90 days from the signed approval date. A new Infection Prevention Risk Assessment and Infection Prevention Mitigation Plan must be completed on or before the expiration date.

Table A describes the type of construction activity. The type of “Construction Activity” is first identified by selecting the level of activity that best describes the project being planned.

Table B identifies the “Population and Geographic Risk Group” that may be affected by the project because of its physical proximity or potential exposure to the activity.

Table C identifies the appropriate class of infection prevention measures by matching the construction activity with the population risk group. As indicated in Table C, the appropriate dust mitigation measures for the project are identified. A copy will be reviewed and approved by HEIP and filed by Design and Construction or Facilities Management for all Class III and IV categories. Adaptations to the prevention measures may be made only after approval has been provided by HEIP.

Construction compartment negative air monitoring

A. If required for the project, negative air pressure must be monitored at all times during the duration of the project and documented daily by Design and Construction.

B. If positive or neutral air pressure is identified, work must be suspended, barrier investigation must be completed, and negative air pressure restored before resuming work.

C. When the option to vent the exhaust of the HEPA filter unit is determined either not to be feasible or necessary, the Project Manager in consultation with HEIP and Facilities Management may conclude that the HEPA unit be used as a “scrubber only”.

A copy of the Infection Prevention Risk Assessment and Mitigation Plan must be sent to HEIP when matrix indicates Class III or Class IV preventive measures are required.

Comments:

Table A Type of Construction Activity

Type A | Inspection and non-invasive activities. These include, but are not limited to:

- removal of ceiling tiles for inspection (up to 4 sq. feet)
- movement of equipment, building structures, etc. for visual inspection
- painting (but not sanding)
- putting up wall covering, electrical trim work, minor plumbing, and activities which do not generate dust or require cutting of walls or access to ceilings other than for visual inspection.

Type B | Small scale, short duration activities that create minimal dust. These include, but are not limited to:

- installation of telecommunications cabling
- access to chase spaces
- cutting of walls or ceiling where dust migration can be controlled.

Type C | Work that generates a moderate to high level of dust or requires demolition or removal of any fixed building components or assemblies (e.g., counter tops, cupboards, sinks). These include, but are not limited to:

- sanding of walls for painting or wall covering
- removal of floor and wall coverings, baseboards, ceiling tiles and casework
- new wall construction
- minor duct work or electrical work above ceilings
- major cabling activities
- any activity which cannot be completed within a single work shift.

Type D | Major demolition, construction and renovation projects. These include, but are not limited to:

- activities which require consecutive work shifts
- heavy demolition or removal of a complete cabling system is required
- new construction.

Please check the ICRM Plan for the project determined by the ICRA

**CLASS I**
- (includes Class I)
- □

1. Execute work by methods that minimize generating dust from construction operations.
2. Immediately replace ceiling tile displaced for visual inspection.
3. Immediately remove incidental dust using HEPA vacuum or damp dusting.
4. Clean work area upon completion of task.

**CLASS II**
- (includes Class I)
- □

1. Obtain infection prevention permit before construction begins.
2. Provide active means to prevent dust from dispersing into atmosphere
3. Water mist work surfaces to control dust while cutting.
4. Seal unused doors with tape.
5. Air vents may require sealing; consult with Facilities Mgmt.
6. Wipe surfaces with disinfectant.
7. Construction workers will vacuum clothes with HEPA Vacuum before leaving work area.
8. Contain construction waste before transport in covered containers.
9. Wet mop and/or vacuum with HEPA filtered vacuum before leaving work area.
10. Place adhesive walk-off mats inside work area (and outside of work area if safety allows).
11. Ceiling or wall access outside construction zone may require separate enclosure (permit required).

**CLASS III**
- (includes Class II)
- □

1. Seal air vents and Isolate HVAC system in area where work is being done. Consult with project specifications.
2. Complete all critical barriers or implement portable mitigation unit before construction begins.
3. Seal all holes, pipes, conduits and penetrations appropriately.
4. Maintain negative air pressure within work site utilizing HEPA-equipped air filtration units.
5. Do not remove barriers from work area is thoroughly cleaned.
6. Vacuum work with HEPA filtered vacuum
7. Wet mop with disinfectant.
8. Remove barrier materials to minimize dirt and debris.
10. Air sampling required for work performed for Groups 3 and 4 populations and geographic risk groups meeting one of the following criteria:
   a. Projects lasting > 2 weeks duration
   b. Projects requiring repair of water damaged areas in which water damage has been present for >72 hrs. or unknown duration.

**CLASS IV**
- (includes Class III)
- □

1. If walls are not full height, exposed wall or ceiling space must be sealed.
2. Construct vestibule and require all personnel to vacuum off in this room using a HEPA vacuum cleaner before leaving work site. Alternatively, they can wear cloth or paper coveralls that are removed each time they leave the work site.
3. Continuous Differential Pressure Monitoring required for Groups 3 and 4 populations and geographic risk groups.
4. Air Sampling required for Groups 3 and 4 populations and geographic risk groups.
5. Do not remove barriers from work area until completed project is inspected by Design and Construction or Facilities Management representatives and thoroughly cleaned. Remove barrier materials to minimize dust and debris.
6. Upon completion of work, remove isolation of HVAC system in areas where work is being performed. Follow established procedures for re-starting HVAC or water.
7. All personnel entering work site are required to wear shoe covers. Shoe covers must be changed each time the worker enters the work area.

VIII. APPENDIX 5.1B

Dust Mitigation Training Syllabus Outline for Contractors

Construction/Demolition/Renovation can generate dust and debris that may contain germs that can be transmitted by dust.

- People with healthy immune systems are generally not at risk for dust-related disease.
- Patients can be infected by mold and other germs by breathing in contaminated air.
- UCSF Medical Center proudly cares for solid organ transplant patients, bone marrow transplant patients, cancer patients, and other patients with compromised immune systems and who are exquisitely susceptible to dust-related disease.
- Dust can cause life-threatening disease in immune compromised patients such as pneumonia or brain infection.

Dust mitigation for Indoor Construction Projects

The extent of the specific measures employed for dust mitigation in a project will depend on the anticipated amount of dust generation, the location(s) of the project, duration of the project and patient populations in the vicinity of the project.

- The contractor and University’s project manager will complete a risk assessment.
- The Infection Prevention Risk Assessment and Infection Prevention Mitigation Plan will automatically expire 90 days from the signed approval date. A new Infection Prevention Risk Assessment and Infection Prevention Mitigation Plan must be completed on or before the expiration date.
- Adjacent units’ managers must be notified of the project and updated when needed.
- Construction barricades must be sealed from floor to underside of floor above.
- When space is available a vestibule will be created adjacent the barricade.
- Barricades will have gasketed door frames (or zipper doors at plastic barricades) with self-closures and access controls.
- All penetrations into construction areas will be sealed (around piping, windows closed) and air ducts will be capped as determined in the pre-construction meeting.
- Signage with the University’s project manager’s name and 24-hour contact information must be posted outside the construction zone.
Guidelines for Construction/Renovation/Demolition Projects and Environmental Control of Invasive Fungal Infection and other Hospital Acquired Infection

The signage will include the approved Infection Prevention Risk Assessment and Mitigation Plan, Pre-Construction Survey and all required ILSM documents.

- Adhesive walk off mats shall be placed inside the construction barricade and outside the barricade door.
- Most projects will require the use of High Efficiency Particulate Air (HEPA) filter units to maintain negative pressure within the construction barricade. The HEPA units will be certified within the last year, contain clean filters, have discharge hoses vented to the outside when possible, and create a negative air pressure within the barricade with door open and an air flow of at least 100 feet per minute at all times. The use of differential pressure monitoring will be required for class IV projects;
- When the option to vent the exhaust of the HEPA filter unit is determined either not to be feasible or necessary, the Project Manager in consultation with HEIP and Facilities Management may conclude that the HEPA unit be exhausted to an adjacent internal space using a filtered diffuser or used as a “scrubber only”.
- A clean jobsite must be maintained. All dust must be contained within the construction barrier.
- Any dust tracked outside the barricade must be removed by wet mop or HEPA vacuum immediately. Debris removal will be performed in clean containers with covers, along a pre-determined route. Exterior and wheels of container must be wiped down prior to transporting.
- Construction activities outside the barricades require the use of a full height polyethylene sheet barrier, completely taped at the edges and seams. A zipper flap is required for access. Negative air may be required at the opening.
- When ceiling/wall access is required outside the construction barricades, a polyethylene enclosure must be utilized in areas where patients are housed or transported. Negative air containment may be required. A ceiling/wall access permit is required and must be obtained from UCSF Facilities Parnassus Room L210 (353-1120) or Mount Zion Room 06 (885-7576).
- Depending on the scope of the project, HEIP and the University’s Project Manager may require construction workers leaving the construction barricades to vacuum the outside of their clothing with a HEPA vacuum or will put on a clean disposable paper suit just prior to leaving the barricade.
- Air sampling may be collected at strategically important locations (as determined by HEIP and EH&S), prior to demolition and during demolition of the construction projects to assess the effectiveness of dust mitigation at the project site.
- All Class IV projects in population and geographic locations Groups 3 and 4 will require air sampling; Air sampling may be required for Class III Projects (See IPRA).
- The Department of Hospital Epidemiology and Infection Prevention (HEIP), Design and Construction and Facilities staff will regularly inspect the project site for adherence to dust mitigation measures. Any breach of compliance with dust mitigation measures may be subject to a fine or stop work order until acceptable particulate levels
are restored and compliance measures are in place, as per project specifications.

- If dust mitigation measures are either not in compliance or barriers and/or measures fail, it is the responsibility of the observer to notify the Project Manager and construction supervisor for immediate remedy. The Project Manager shall then communicate the non-compliance or failure to the Infection Prevention/Interim Life Safety Measures monitor for inspection and documentation.

- All on-site workers involved in any type of demolition, construction, or remodeling work must attend an in-service sponsored by HEIP. Material reviewed includes: reasons for dust mitigation measures during demolition and construction projects in and around the medical center, patient populations served at UCSF, infectious agents of concern, air sampling for mold spores, and specific measures for dust mitigation. Contractors must retain a list that documents workers who have attended an in-service. This in-service must be completed at least annually. HEIP and Facilities Management reserve the right to require anyone to complete the training again.

- The contractor shall inform all workers on the jobsite not to enter the Medical Center if they suspect they have a symptomatic illness that could spread to others.

- Painting activities may involve dust generation (sanding, removing base coving, etc.). Evaluate each project per Risk Assessment.

- Floor covering removal may generate dust. Evaluate each project per Risk Assessment.

- Per the approved project Infection Prevention Risk Assessment and Mitigation Plan, HEIP and Facilities Management must approve the progression of cleaning order in which barrier removal.

**Dust Mitigation for Major Outdoor Construction Projects**

- Windows on units facing outdoor construction must be shut and disabled.

- Signs will be placed on doors leading to outside stairwells that face external construction projects to limit non-emergency traffic.

- Facilities Management will monitor air filters attached to building supply fans or air handling units. Increased dust generation related to construction may require increased maintenance.

- A letter will be sent by Patient Care Services advising patients and visitors of the disruptions and the hazards of dust.

- The Project Manager will inform UCSF Medical Center staff via email as to the procedures in place for dust mitigation as well as construction activity schedules.

- All activities that create dust must be continuously hosed down with water.

- Soil must also be kept moist as soil may contain germs that may be aerosolized.

- Loose debris will be moist when loaded for hauling.

- Debris to be hauled away by trucks will be moist and covered prior to hauling.

- Roadways will be free of dirt and washed daily.
Guidelines for Construction/Renovation/Demolition Projects and Environmental Control of Invasive Fungal Infection and other Hospital Acquired Infection

- Soil containing *Legionella* may enter plumbing system through cracked pipes. Report any disturbed, cracked or broken pipes to the project manager.
- The University’s Infection Prevention/Interim Life Safety Measures Monitor will complete a check-list to ensure above dust mitigation measures are performed each day. Any breach of compliance with dust mitigation measures may be subject to a fine, as specified in the project specifications.
- Contractor to cease dust-producing activities if water is not available or if a situation arises leading to uncontrollable dust generation.
- UCSF HEIP, Design and Construction, and Facilities management staff reserve the right to inspect the project site for adherence to dust control measures.
- Construction workers working on outdoor projects may not enter the Medical Center unless free of dust.
- Air sampling will be completed at strategically important locations Pre and Post demolition and construction phases of projects. The purpose of the air sampling is to assess dust mitigation at the project site.
- If deemed necessary by the Safety Officer, the University’s Project Manager, or HEIP, a traffic attendant may be stationed near the project site to direct traffic.
- All on-site construction workers must attend an in-service sponsored by HEIP. Materials to be reviewed include rationale for dust mitigation measures in demolition and construction projects in and around the medical center, patient populations served at UCSF, infectious agents of concern, air sampling for mold, and specific measures for dust mitigation.
- A contact phone number will be provided to Medical Center staff, patients, and visitors by the University’s Project Manager to answer general questions regarding the project.
Post Test for Infection Prevention & Safety for Construction Personnel
(Circle the best answer: True or False)

1. Dust containing mold and other germs can cause serious illness and even death to some patients.
   TRUE    FALSE
2. Construction, demolition, renovation and excavation can generate dust containing mold spores and other germs.
   TRUE    FALSE
3. If you find an injection needle in your work site you should pick it up and throw it out in the garbage.
   TRUE    FALSE
4. Utility services (water, gas, electric) must not be shut off without approval from Facilities Management, except in an emergency.
   TRUE    FALSE
5. It is acceptable to leave the work site and enter the hallway if your work clothes are covered in dust.
   TRUE    FALSE
6. Barriers placed around job sites help to prevent dust from entering patient care areas.
   TRUE    FALSE
7. Adhesive walk-off mats need to be changed only daily.
   TRUE    FALSE
8. For large construction projects, HEPA filtered fan units running in the job site are required to scrub the air and create negative pressure.
   TRUE    FALSE
9. Remove debris using an open container via any route and at times when patients are present.
   TRUE    FALSE
10. During outdoor demolition soil and debris should be kept dry.
    TRUE    FALSE
11. Air sampling during construction and demolition can help determine if Infection Prevention measures for dust control are working.
    TRUE    FALSE
12. All on-site construction workers must attend an Infection Prevention in-service. This in-service must be completed at least annually.
    TRUE    FALSE
13. Workers who are sick with a cold, flu or other communicable illness should not enter the medical center.
    TRUE    FALSE
14. You must turn off all HEPA negative air machines before leaving the jobsite at the end of each working day.
    TRUE    FALSE
15. It is permissible to open a ceiling hatch or ceiling tile in a corridor if you only need to look for less than 10 seconds.
    TRUE    FALSE

CONTINUED ON OTHER SIDE
16. If you are not sure if a utility line is live or dead you must contact job superintendent immediately.
   TRUE   FALSE

17. If you are in a service elevator and a patient needs to be transported in that same elevator, you must vacate the elevator even if there is enough room for both of you to ride, with or without tools or materials, no exceptions.
   TRUE   FALSE

18. You can use passenger elevators to transport materials and equipment. TRUE   FALSE

19. If construction dust needs to continually be removed in the corridors outside the project area, it is possible that there is airborne dust in the corridor and you should notify your job superintendent.
   TRUE   FALSE

20. A HEPA negative air machine unit running in a construction space will always produce negative air within the project site.
   TRUE   FALSE

21. Infection Prevention, Design and Construction, and Facilities Management can stop a job at any time for dust control violations.
   TRUE   FALSE

22. Ceiling and wall access permits are not required for portable barriers in the medical center. TRUE   FALSE

23. HEPA machine certification is good for 2 years.
   TRUE   FALSE

24. Interim Life Safety Measures are put in place to take the place of safety systems that may have been removed or disabled during construction.
   TRUE   FALSE

25. Corridors may be temporarily blocked by construction activity as long as worker is present and it can be cleared within 5 minutes.
   TRUE   FALSE

26. Before entering and after leaving a patient care area, you must wash your hands with either soap and water or an alcohol-based hand rub.
   TRUE   FALSE

By signing below, I am confirming that I have viewed and understand all of the content presented in the training video. I also understand that Infection Prevention and Safety measures are important to safe patient care and UCSF Medical Center operations; I will adhere to all infection Prevention and safety requirements.

A final survey of Infection Prevention measures as described in Contract Specification Section 01021 was conducted. The following Infection Prevention measures have been incorporated in this report and approval is hereby given to proceed with demolition and/or construction activities as described in the contract documents. Contractor is responsible to ensure that the Infection Prevention dust mitigation measures attested to in this document remain in effect for the duration of the project.

MEASURES IN PLACE and Confirmed / Completed by Project Manager:

1. Infection Prevention dust mitigation education in-service provided with contractor and construction workers. This education must be completed at least annually for every on-site worker. It is the responsibility of the contractor to maintain a record of attendance; these records may be requested by HEIP at any time.

   All workers Current Y   N

2. Date negative air machines certified by DOP test (within one year) ___/___/___

3. Construction space has negative air pressure with barricade door fully open (≥100fpm)

<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Multilingual signs to remind patients and staff to keep windows closed posted on all windows</td>
<td></td>
</tr>
</tbody>
</table>
<details>
<summary>Doors</summary>

- Multilingual signs attached to all doors leading to the stairwells (facing the construction activities generating dust) reminding staff, patients, and visitors not to use the doors except for emergency (during demolition only)
- Security will help monitor stairwell during land demolition phase
- All affected stairwell doors have been gasketed and have had closing devices installed
- Plastic curtains have been installed across the large openings; i.e., breezeways, stairwells, etc. on affected levels

#### Elevators

- During the hard demolition phase, staff will be encouraged to transfer immune-compromised patients using Moffitt elevators or to mask the patient
- A daily cleaning schedule is in place

#### Loading Docks Facing Construction Activities

- Doors and curtains are propped or tied open when not in use
- Elevator vestibule doors will be kept closed when not in use
- Fliers have been distributed by project manager to delivery drivers explaining loading dock procedures

#### Air Intakes

- Filters will be monitored by Facilities Maintenance for more frequent replacement
- Air quality monitoring samples will be taken down stream of the supply fans to monitor air quality
- Additional pre filters will be installed as needed

#### Education

- A letter will be sent by Patient Care Services to advise patients and visitors of the disruptions and hazards of dust
- Medical Center personnel will be educated on the procedures in place for the project via campus publications and fliers

</tbody>
</table>

**Education**

Prior to beginning work, all on-site construction workers shall attend a mandatory in-service sponsored by the UCSF Department of Hospital Epidemiology and Infection Prevention (HEIP). Materials to be reviewed include rationale for dust mitigation measures in demolition and construction projects in and around the hospital, patient populations served at UCSF, infectious agents of concern, air sampling for mold, and specific measures for dust mitigation.

Records of attendance will be maintained by the Contractor(s) and made available upon request.

Contractor/Engineer shall attend Construction Advisory Committee meetings when requested.

**Monitoring**

At the discretion of HEIP, air sampling to be performed by Office of Environmental Health and Safety to monitor air quality and identify any dust mitigation problems.

Unannounced monitoring for dust compliance by HEIP, Facilities, and project site Manager.

Specific traffic control measures per individual project will be assessed and instituted as part of the Risk Assessment.

Concerns from the department managers who may be affected will be voiced to the contractor through Design and Construction and corrective action will be taken.

Hospital Operating Room personnel have been given the authority to halt the construction if an emergency situation related to vibration develops within the operating rooms.

A contact phone number is in place to answer general questions regarding the project. The phone number is:

Action Levels ......................................................................................................................................5

AIR SAMPLING REQUESTS AND REPORT FORM

The purpose of air sampling is to assess dust and microbial mitigation measures in and around construction project sites around the Medical Center. In addition to particulate measurements, viable air sampling for mold may be collected at strategically important locations during the demolition and construction phases of projects at the direction of HEIP. For lengthy projects, multiple air samplings may be required. If analysis of particulate counts or mold samples collected are found to be unacceptable, construction activities may be ordered stopped by HEIP. Air sampling for mold in areas exceeding acceptable ranges listed within this policy should be repeated after thorough project site evaluation and after corrections have been made in areas where mitigation of dust and microbial growth is compromised.

Department Responsibility

Department of Hospital Epidemiology and Infection Prevention (HEIP):

1. Performs patient surveillance by reviewing microbiology and autopsy reports, investigating nurse/physician reports, and performing chart review as needed.
2. Identifies areas requiring air sampling prior to construction utilizing a walk-through assessment with Design and Construction Project Manager.
3. Utilizing Medical Center Support Services (MCSS), requests air sampling via Air/Water/Environmental Sampling request category >5 business days prior to
the start of scheduled construction project. The requesting Infection Control Practitioner is to attach the signed ICRA and contact info the project manager.

4. Monitors and inspects construction projects (or delegates to trained Facilities personnel), and plans concurrent meetings as needed. Requests additional air sampling related to construction as needed.

5. Orders additional event-related air sampling (e.g. post water leakage in ceilings, ceiling tile collapse, etc.).

Office of Environment, Health and Safety (EH&S):

1. Maintains a calibrated TSI AeroTrak Particle Counter.
3. Maintains a limited supply of MEA agar plates (at least 1 sleeve of 10 plates).
4. Conducts particle count IAW MCSS ticket and attached Air Sample Project Sheet.
5. Performs fungal sampling using SAS for speciation analysis when indicated by particle count results or at the specific request of HEIP.
6. Records and reports results of all air sampling on the Air Sampling Project Sheet and attaches to appropriate MCSS ticket.

Office of Design, Construction and Facilities Management:

1. Advises HEIP of upcoming construction or maintenance projects.
2. Advises HEIP of dates of specific construction and demolition phases to allow timely ordering of air sampling.
3. Requires a calibrated manometer to be installed at each construction containment as required by the Infection Prevention Risk Assessment and Mitigation Plan (IPRAMP).
4. Utilizing Medical Center Support Services (MCSS), requests air sampling via Air/Water/Environmental Sampling request category >5 business days prior to the start of scheduled construction project. The requesting project manager is to attach the ICRA that has been signed and approved by HEIP.

Monitoring Strategy

Air Sampling:

a) *Ad-hoc sampling* may be requested by HEIP as needed (i.e. in response to an identified case of healthcare-associated mycosis, a potential cluster of fungal disease, or construction project – see below). Specific locations and requested date(s) of sampling will be submitted to EH&S via ServiceNow MCSS request.

b) *Particulate and/or viable air sampling* will be conducted by EH&S. Viable samples will be submitted by EH&S to an accredited analytical laboratory for analysis. Laboratory reports received will be attached to the original MCSS request ticket.

c) *Sampling outside air*: A sample of outside ambient air (e.g. ED parking lot and/or loading dock) shall be collected with each sampling to compare to indoor conditions.
Guidelines for Construction/Renovation/Demolition Projects and Environmental Control of Invasive Fungal Infection and other Hospital Acquired Infection

Construction Projects

a) **Air sampling** shall be based upon a completed Infection Prevention Risk Assessment for each project.
   1. Design and Construction shall submit an Infection Prevention Risk Assessment for each project to HEIP during a pre-construction meeting, in advance of initiation of the project.
   2. HEIP personnel or Construction Project Manager (CPM) will complete the MCSS ticket and attach the ICRA signed by HEIP that is automatically routed to EH&S. If recommended by the ICRA, a standard construction projects will initially trigger particulate sampling only.
   3. Based on preliminary particulate sampling results, HEIP may request follow-up viable air sampling.
   4. Should air sampling be needed on an emergent basis, HEIP or the CPM will follow-up the MCSS request with a phone call to designated members of EH&S’ Industrial Hygiene Group.

b) **Locations for sampling** will be decided during construction/maintenance project planning and site walk through by HEIP or by the CPM. Those locations will be detailed in the MCSS ticket submitted to EH&S. Typically, air sampling is obtained outside the barriers. Once onsite, EH&S will determine an additional sample location not impacted by construction (indoor control) for comparison and data quality control.

c) **Outside ambient air sampling** sample of the outside ambient air (ED parking lot and/or loading dock) will be collected with each sampling event to compare to indoor conditions.

d) **Timing of sampling:**
   1. HEIP or the CPM may arrange in advance with EH&S the desired testing dates for specific locations when repeat sampling will be needed during a construction project. Such arrangements shall be notated on the Air Sampling Project Sheet.
   2. HEIP or the CPM will provide >5 business days advance notice for routine construction sampling. EH&S will make reasonable efforts to accommodate urgent requests, such as sampling in response to identified cases of healthcare-associated mycosis or other suspected invasive fungal infection; however, extremely short fuse, large quantity, or off-hours sampling times may require HEIP or the CPM to contract services with a third-party vendor.

Investigation of the air quality of room(s) of patient(s) diagnosed with or suspected of having a healthcare-associated fungal infection of the lower respiratory tract shall be requested by HEIP as follows:

- Sampling of the room(s) occupied by the patient at symptom onset. Sampling shall be scheduled to meet the needs of the specific unit/department involved
- Organism of concern will be included in the request
- May surface or bulk sampling be requested, HEIP will include the desired locations of sampling. EH&S may request the presence of an HEIP representative during this type of sampling for a more efficient process.
Guidelines for Construction/Renovation/Demolition Projects and Environmental Control of Invasive Fungal Infection and other Hospital Acquired Infection

- As needed, HEIP will request inspection of fan room with filtration or any part of the mechanical ventilation system that supplies the involved patient care room(s).

**Sampling Procedure and Reporting Results:**

a. The involved unit/department(s) shall be notified by HEIP or the CPM of the approximate date/time to expect sampling to occur.

b. Items to be addressed in the “Notes” section of the Air Sampling Project Sheet by EH&S staff include physical condition of the area, amount of traffic, time, and weather conditions, open vs. closed windows and doors, etc. Observations should include factors associated with increased risk of the presence of fungal spores such as plants, holes in ceilings or walls, or obviously dusty conditions.
   
   I. Unless otherwise specified, all baseline air sampling requests by HEIP will include particle counts only.
   
   II. Unless otherwise specified, all construction air sampling events will include particle counts only. Based on these results and in consultation with EH&S, HEIP will determine if follow-up viable air sampling is required.
   
   III. HEIP and EH&S will utilize a decision tree model to determine appropriate response actions based on predetermined threshold particulate levels. These levels and responses will be determined by HEIP and be based on the Infection Prevention Risk Assessment value. This decision tree will consider the ambient outdoor sample, barrier indoor sample, and control indoor sample to compare against baseline results and determine the presence and/or source of elevated particle concentrations.

c. Following a sampling event, EH&S will attach the results and a summary attached to the original MCSS request ticket opened by HEIP or by the CPM.

d. Following a sampling event, if additional cleaning in recommended by EH&S, the MCSS requester will contact hospitality services via MCSS to complete the task.

e. HEIP will maintain a database of accumulated fungal counts and relevant information collected at the time of sampling.

f. Regular reports, including walk-through assessments/plans, culture results, interventions and written evaluations will be completed by HEIP staff. As appropriate, these reports will be sent to the Infection Prevention Committee, Office of Environment, Health and Safety, or any other pertinent committee/department.

g. Should repeat air sampling reveal elevated fungal counts, HEIP, EH&S, the Project Manager and/or Facilities Management will investigate for possible sources and determine what, if any, interventions are to be taken. Elevated fungal counts and intervention strategies will be discussed at monthly ICC meetings.
