

Cleaning Plexiglass Barriers

UCSF is installing plexiglass barriers to help ensure the safety of our health care workers who interact frequently with patients and visitors in public areas and other areas where physical distance cannot be maintained.

What should be used to clean plexiglass barriers?

Use a facility-approved disinfectant, following the label instructions.

Examples of approved disinfectants include:

- **Clorox Hydrogen Peroxide**- 1 minute dwell time
- **PDI AF3**- 3 minute dwell time
- **Metrex CaviWipes**- use 2 separate wipes, 3 minute dwell time after the 2nd wipe
- **Medline Micro-Kill Bleach**- 3 minute dwell time
- **Oxivir**- 1 minute dwell time

How often should plexiglass barriers be cleaned?

Clean barriers at least once per shift and when visibly soiled.

How to clean plexiglass barriers?

1. Don clean gloves
2. Wipe both sides of Plexiglass with facility-approved disinfecting wipe per the label instructions
3. Allow Plexiglass to remain undisturbed for the disinfectant dwell time
4. If needed, wipe with alcohol or moist cloth after disinfectant dries to remove haze
